Write code to do something interesting with swarm intelligence that hasn’t been done in class. Note that code (Matlab & Python) is available to you on the web at NeoSwarm.com for many of the swarms. You may present your results in one of two ways.

1. A written report in LaTex of your project along will illustrative videos. Include a separate copy of your code. Zip them all and put them in my dropbox.

2. Present your results orally in class. A power point talk is good. Show videos. Zip and place everything, including code, in my dropbox.

Presentations will be given the last week or so of class depending on how many want to present. If I don’t hear from you before Easter break, I’ll assume you are doing the LaTex report.
